

ISO 14001:

The care for the environment is the great challenge we have to face, the future of the next generations will depend on the actions taken within next years, as a company we need to give determined measures to contribute on all necessary actions to give priority to environment.

Hence in 2018 we certificated our environmental management system according to ISO 14001:15 (CERTIFICATE ES18/85220) certification norm.

We highlight the following commitments to follow as company:

- **Compliance of legal requisites** and other requirements stated by the organization. We have implemented a procedure of identification of regulation and legal requisites that guarantee the adaptation and compliance of the whole related regulation.
- **Integrate the environment protection** within the production chain, both internally and externally through the selection of suppliers prioritizing environmental criteria and commitments.

- Pollution prevention: through the use of less polluting products and the proper residues management.
- Protect the environment through the implementation of residues management systems giving preference to the three “R” principle:
 - **Reduce** the consum of raw materials through the design of lighter packaging, removing unnecessary packing, through purchasing policy of raw materials in big packings to reduce the generated packing and awareness policy towards the consumption of raw materials and natural resources.
 - **Reuse**, through the commitment of our staff so that always tries to give a second use to all objects before making them a residue.
 - **Recycle**, through a residues separation system by types for its subsequent recycling.
- Generation of **clean energy** through solar energy plant and self-supply, trying to maximize consumption efficiency.
